

NMRA Standard	
Layout Command Control™ (LCC) Message Network	
July 22, 2024	S-9.7.3

Adopted as a NMRA Standard

The OpenLCB Standard document appended to this cover sheet has been formally adopted as a NMRA Standard by the NMRA Board of Directors on the date shown in the *Adopted* column in the *Version History* table below.

Version History

Date	Adopted	Summary of Changes
Feb 17, 2015		Initial version submitted for public comment
Feb 6, 2016	Feb 20, 2016	Minor grammatical corrections and readability improvements as well as the following specific changes: <ul style="list-style-type: none"> • Corrected MTI for 3.3.2 Verify Node ID from 0x498 to 0x488 • Added entries to the 3.3.7 Protocol Support Reply table <ul style="list-style-type: none"> ◦ Firmware Upgrade Protocol ◦ Firmware Upgrade Active • Removal of 72 and 254 byte Message Size limits
Apr 25, 2021	July 2, 2021	Changed LCC logo to include the ® symbol Changed “Layout Command Control” to have the ™ symbol Added the NMRA Legal Disclaimer fine-print Changed the OpenLCB license to “Creative Commons Attribution-ShareAlike 4.0 International”
July 22, 2024		Update the table of PIP bits Clarify the content of the OIR message Clarified the discussion of priorities

Important Notices and Disclaimers Concerning NMRA Standards Documents

The Standards (S), Recommended Practices (RP), Technical Note (TN) and Technical Information (TI) documents of the National Model Railroad Association (“NMRA Standards documents”) are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page, appear in all standards and may be found under the heading “Important Notices and Disclaimers Concerning NMRA Standards Documents.”

Notice and Disclaimer of Liability Concerning the Use of NMRA Standards Documents

NMRA Standards documents are developed within the Standards and Conformance Department of the NMRA in association with certain Working Groups, members, and representatives of manufacturers and sellers. NMRA develops its standards through a consensus development process, which brings together volunteers representing varied viewpoints and interests to achieve the final product. NMRA Standards documents are developed by volunteers with modeling, railroading, engineering, and industry-based expertise. Volunteers are not necessarily members of NMRA, and participate without compensation from NMRA.

NMRA does not warrant or represent the accuracy or completeness of the material contained in NMRA Standards documents, and expressly disclaims all warranties (express, implied and statutory) not included in this or any other document relating to the standard or recommended practice, including, but not limited to, the warranties of: merchantability; fitness for a particular purpose; non-infringement; and quality, accuracy, effectiveness, currency, or completeness of material. In addition, NMRA disclaims any and all conditions relating to results and workmanlike effort. In addition, NMRA does not warrant or represent that the use of the material contained in NMRA Standards documents is free from patent infringement. NMRA Standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

Use of NMRA Standards documents is wholly voluntary. The existence of an NMRA Standard or Recommended Practice does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the NMRA Standards documents. Furthermore, the viewpoint expressed at the time that NMRA approves or issues a Standard or Recommended Practice is subject to change brought about through developments in the state of the art and comments received from users of NMRA Standards documents.

In publishing and making its standards available, NMRA is not suggesting or rendering professional or other services for, or on behalf of, any person or entity, nor is NMRA undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any NMRA Standards document, should rely upon their own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given NMRA Standards documents.

IN NO EVENT SHALL NMRA BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: THE NEED TO PROCURE SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD OR RECOMMENDED PRACTICE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

Translations

NMRA’s development of NMRA Standards documents involves the review of documents in English only. In the event that an NMRA Standards document is translated, only the English version published by NMRA is the approved NMRA Standards document.

Official Statements

A statement, written or oral, that is not processed in accordance with NMRA policies for distribution of NMRA communications, or approved by the Board of Directors, an officer or committee chairperson, shall not be considered or inferred to be the official position of NMRA or any of its committees and shall not be considered to be, nor be relied upon as, a formal position of NMRA.

Comments on Standards

Comments for revision of NMRA Standards documents are welcome from any interested party, regardless of membership. However, **NMRA does not provide interpretations, consulting information, or advice pertaining to NMRA Standards documents.**

Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since NMRA standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, NMRA, its departments, Working Groups or committees cannot provide an instant response to comments, or questions except in those cases where the matter has previously been addressed. For the same reason, NMRA does not respond to interpretation requests. Any person who would like to participate in evaluating comments or in revisions to NMRA Standards documents may request participation in the relevant NMRA working group.

Laws & Regulations

Users of NMRA Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any NMRA Standards document does not constitute compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. NMRA does not, by the publication of NMRA Standards documents, intend to urge action that is not in compliance with applicable laws, and NMRA Standards documents may not be construed as doing so.

Copyrights

NMRA Standards documents are copyrighted by NMRA under US and international copyright laws. They are made available by NMRA and are adopted for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of modeling, structural and engineering practices and methods. By making NMRA Standards documents available for use and adoption by public authorities and private users, NMRA does not waive any rights in copyright to the NMRA Standards documents.

IMPORTANT NOTICE

NMRA Standards documents do not guarantee or ensure safety, security, health, or environmental protection, or ensure against interference with or from other systems, devices or networks. NMRA Standards documents development activities consider research and information presented to the standards development group in developing any safety recommendations. Other information about safety practices, changes in technology or technology implementation, or impact by peripheral systems also may be pertinent to safety considerations during implementation of the standard. Implementers and users of NMRA Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.

OpenLCB Standard	
Message Network	
July 22, 2024	Adopted

1 Introduction

This Standard contains normative information about the OpenLCB Message Network. Corresponding discussion and background can be found in the corresponding OpenLCB Message Network Technical Note.

- 5 The protocol is described via three components: the state machine within the node(s); the messages; and the basic interactions in which the nodes take part. These are separately described below in terms of the general format as well as specific message definitions.

- 10 Messages are transported across a specific data-link level implementation, for example using CAN frames, TCP/IP sockets, or other transports. The messages are described first in general terms, then mapped to specific implementations (see Sections 8 and beyond). The states and interactions are the same across all data-link implementations.

2 Intended Use

The messages and interactions described here are used by all OpenLCB nodes to connect to the OpenLCB network. **They are mandatory.**

15 2.1 References and Context

For background information on format and presentation, see:

- OpenLCB Common Information Technical Note

This Standard is in the context of the following OpenLCB Standard:

- 20
- The OpenLCB Unique Identifiers Standard, which specifies Unique Identifiers and how they are defined.

This Standard is in the context of the following OpenLCB CAN Standards:

- The OpenLCB CAN Frame Transfer Standard, which specifies transfer of OpenLCB messages over CAN segments. “CAN” refers to the electrical and protocol specifications as defined in ISO 11898-1:2003 and ISO 11898-2:2003 and their successors.

- 25 This Standard is in the context of the following OpenLCB-TCP/IP Standards:

- The OpenLCB-TCP/IP Segment Transfer Standard, which specifies transfer of OpenLCB messages over TCP/IP links.

Conformance with a later version of a referenced standard shall be accepted as conformance with the referenced versions.

30 **3 Messages**

3.1 Message Format

OpenLCB messages are sent using the transfer mechanism and format described in the Standard for a specific wire protocol.

35 All messages shall contain a source Node ID and a Message Type Indicator (MTI). The MTI defines both the general format of the message and its specific type. All messages with the same MTI are of the same type.

3.1.1 Message Type Indicators

40 The general Message Type Indicator (MTI) is a 16-bit quantity. The MTI values are remapped for specific wire protocols, see the appropriate sections of this document for adaptation to CAN and TCP/IP.

The current allocations are documented in a separate spreadsheet¹. We keep them in just that one place to avoid conflicting updates. Those allocations are normative.

MTI – Message Type Indicator																
Bit(s)	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Field	Reserved		Special	Stream or Datagram	Priority		Type within Priority			Simple Protocol	Address Present	Event Present	Modifier			

¹See the associated TN, which provides concrete examples that may help you understand the material in this document.

MTI Bit-field Descriptions				
Field Name	Bit Position	Size bits	Mask hex	Description
Reserved	14 - 15	2	0xC000	Reserved for future use, send and check as zero.
Special	13	1	0x2000	Operationally special, 1=do not forward through Gateways
Stream or Datagram	12	1	0x1000	0=Regular message, 1=Stream or Datagram message
Priority	10 - 11	2	0x0C00	Gross priority of message, 0 is highest priority
Type within Priority	5 - 9	5	0x03E0	Minor priority determination
Simple Protocol	4	1	0x0010	1=This message should be handled by simple nodes
Address Present	3	1	0x0008	1=This message has a destination address-field
Event Present	2	1	0x0004	1=This message has an event-field
Modifier	0 - 1	2	0x0003	Message-specific extra information

45 Note that these fields inform the intent of the message, but also the overall format of the rest of the message.

3.1.2 Message Content

The message content consists of:

- 50
- The MTI
 - The source Node ID
 - If the MTI flags it as being present, the destination Node ID
 - If the MTI flags it as being present, an Event ID
 - Any other content as defined for the specific message type.

55 The exact format and order are defined by the specific wire protocols, but in all cases the message shall be fully decodable based on the flag-bit information in the MTI.

3.2 States

The message network layer in an OpenLCB node has two states:

- 60
- Uninitialized
 - Initialized

Nodes shall start in the Uninitialized state.

A node in the Uninitialized state may transmit an Initialization Complete message, but shall not transmit any other message type.

A node in the Initialized state may transmit any message type.

65

3.3 Definition of Specific Messages

70 This section defines the format of common core messages. Although there is a short description of the purpose of the message, and related interactions, this is just for identification and explanatory purposes. The meaning of the messages is defined by the interactions in which they take part. These are described in later sections.

When a Node ID is present in the data content of the message, the full 48-bit identifier shall be sent for all wire protocols, specifically including CAN, even if an alias or alternate form is available elsewhere in the message.

3.3.1 Initialization Complete

75 Indicates that the sending-node initialization is complete and, once the message is delivered, it is reachable on the network.

Name	Description	Simple Protocol	Dest ID	Event ID	Common MTI	Data Content
Initialization Complete	Full Protocol Required	0	0	0	0x0100	Source Node ID
	Simple-set Sufficient	0	0	0	0x0101	

This message has two MTIs, distinguished by the modifier field, to indicate whether the node requires delivery of all the messages in the full protocol, or whether delivery of the Simple Protocol subset is sufficient.

80 3.3.2 Verify Node ID

Issued to determine which node(s) are present and can be reached.

Name	Description	Simple Protocol	Dest ID	Event ID	Common MTI	Data Content
Verify Node ID	Addressed	0 ²	1	0	0x0488	<u>Optional</u> Full Node ID
	Global	1	0	0	0x0490	

3.3.3 Verified Node ID

Reply to the Verify Node ID message.

Name	Description	Simple Protocol	Dest ID	Event ID	Common MTI	Data Content
Verified Node ID Number	Full Protocol Required	1	0	0	0x0170	Source Node ID
	Simple Subset Sufficient	1	0	0	0x0171	

² Addressed messages are always directed to the destination node, regardless of the content of the Simple bit. See section 4

- 85 This message has two MTIs, distinguished by the modifier field, to indicate whether the node requires delivery of all the messages in the full protocol, or whether delivery of the Simple Protocol subset is sufficient.

3.3.4 Optional Interaction Rejected (OIR)

This is a reply indicating failure.

Name	Simple Protocol	Dest ID	Event ID	Common MTI	Data Content
Optional Interaction Rejected	0	1	0	0x0068	Error code, MTI, optional info

- 90 The data contents are, in order:
- Two bytes of error code.
 - Two bytes of MTI. If the frame transport only delivered part of the MTI³, that content is returned with the rest of the MTI bits set to zero.
 - Any extra bytes that the node wishes to include. There can be zero or more of these, to a maximum of 64 bytes. These shall be described in the node documentation.
- 95

Nodes shall process this message even if not all of the contents are provided.

For Error Codes see section [3.5.5 Error Codes](#), and section [3.5 Error Handling](#).

3.3.5 Terminate Due to Error

This is a reply indicating failure.

Name	Simple Protocol	Dest ID	Event ID	Common MTI	Data Content
Terminate Due to Error	0	1	0	0x00A8	Error code, MTI, optional info

- 100 The contents are, in order:
- Two bytes of error code.
 - Two bytes of MTI. If the frame transport only delivered part of the MTI⁴, that content is returned with the rest of the MTI bits set to zero.
 - Any extra bytes that the node wishes to include. There can be zero or more of these, to a maximum of 64 bytes. These shall be described in the node documentation.
- 105

Nodes shall process this message even if not all of the contents are provided.

For error codes see section [3.5.5 Error Codes](#) and section [3.4.3.Error Handling](#).

3.3.6 Protocol Support Inquiry

Requests that the addressed node reply with an indication of which protocols it supports.

³For example, in this case, CAN delivers 12+1 bits of the MTI via each frame (the special bit is known to be zero).

⁴For example, in this case, CAN delivers 12+2 bits of the MTI via each frame (the special bit is known to be zero and the stream/datagram bit can be inferred).

Name	Simple Protocol	Dest ID	Event ID	Common MTI	Data Content
Protocol Support Inquiry	0	1	0	0x0828	(none)

110

3.3.7 Protocol Support Reply

Replying indicating the protocols that the node supports.

Name	Simple Protocol	Dest ID	Event ID	Common MTI	Data Content
Protocol Support Reply	0	1	0	0x0668	One or more bytes identifying the supported protocols; see Table immediately below for coding.

115

A 1 in a bit position of the data indicates that the corresponding protocol is supported by the transmitting node. A 0 in the bit position indicates that the corresponding protocol is not supported by the transmitting node.

If a node transmits less than the full length of the currently-defined reply data, any missing bits shall be interpreted as zero.

120

Note that a number of these bits are assigned to protocols that were or are under development, and have not yet reached the level of maturity of an adopted OpenLCB standard. For an overview about the status of adoption of these protocols, please see the status page on the OpenLCB web site.⁵

⁵<https://openlcb.org/status/#pip>

Protocol	Protocol Flags
Simple Protocol subset	0x80 00 00
Datagram Protocol	0x40 00 00
Stream Protocol	0x20 00 00
Memory Configuration Protocol	0x10 00 00
Reservation Protocol	0x08 00 00
Event Exchange (Producer/Consumer) Protocol	0x04 00 00
Identification Protocol	0x02 00 00
Teaching/Learning Configuration Protocol	0x01 00 00
Remote Button Protocol	0x00 80 00
Abbreviated Default CDI Protocol	0x00 40 00
Display Protocol	0x00 20 00
Simple Node Information Protocol	0x00 10 00

Train Control Protocol	0x00 04 00
Function Description Information (FDI)	0x00 02 00
Reserved. Shall be sent as 0 and ignored upon receipt.	0x00 01 00
Reserved. Shall be sent as 0 and ignored upon receipt.	0x00 00 80
Function Configuration	0x00 00 40
Firmware Upgrade Protocol	0x00 00 20
Firmware Upgrade Active	0x00 00 10
Reserved for future protocol bits. Shall be sent as 0 and ignored upon receipt. Trailing 0-bytes do not need to be sent.	All others

3.4 Interactions

All nodes shall be able to take part in all standard interactions, as defined below.

3.4.1 Node Initialization

125 Newly functional nodes, once their start-up is complete and they are fully operational, shall send an Initialization Complete message and enter the Initialized state. Nodes shall not emit any other OpenLCB message before the Initialization Complete message.

3.4.2 Node ID Detection

Upon receipt of a directed (addressed) Verify Node ID message addressed to it, a node shall reply with an unaddressed Verified Node ID message.

- 130 Upon receipt of a global (unaddressed) Verify Node ID message that does not contain an (optional) Node ID, a node shall reply with an unaddressed Verified Node ID message.

Upon receipt of a global (unaddressed) Verify Node ID message that contains an (optional) Node ID, a node will reply with an unaddressed Verified Node ID message, if and only if the receiving node's Node ID matches the one received.

- 135 If a node receives multiple Verify Node ID messages before it replies to one or more, it may, but is not required to, combine multiple responses into one.

3.4.3 Protocol Support Inquiry and Response

On receipt of a Protocol Support Inquiry message, a node will reply with a Protocol Support Response with bit values corresponding to the protocols that the node implements.

140

3.5 Error Handling

There are multiple error-handling scenarios defined.

3.5.1 Reject Addressed Optional Interaction

- 145 If a Node receives an addressed message with an MTI that is not part of the mandatory set, and it does not want to take part in that interaction, it shall send an Optional-Interaction Rejected (OIR) message addressed to the originating node. This shall contain the fields defined in section 3.3.4. The OIR message content may also contain a reason code and a data value, as defined by the protocol, as listed below in section 3.5.5.

3.5.2 Reject Unaddressed Optional Interaction

- 150 If a Node receives an unaddressed message with an MTI that indicates the start of a non-mandatory / optional interaction, and the Node does not take part in that optional interaction, it may silently drop the message without reply.

3.5.3 Reject Addressed Standard Interaction Due to Error

- 155 If a Node is taking part in an addressed interaction with another node, where either node may be able to send the next message, and some error condition prevents this Node from continuing the interaction, to terminate the interaction, this Node shall send a Terminate Due to Error message to the other Node. It shall reset its state so as to no longer be taking part in the addressed interaction. The message content shall contain the most recent MTI received in this interaction, a mandatory reason code and an optional data value.

- 160 In addition, upon receipt of the Terminate Due to Error message, the other Node also shall reset its state so as to no longer be taking part in the addressed interaction.

3.5.4 Duplicate Node ID Discovery

OpenLCB nodes shall indicate an error when they detect an incoming message with a Source Node ID equal to their own using whatever indication technology is available. See the General Event documentation for one method of indication that uses a well-known Global-Event.

3.5.5 Error codes

Numerous messages are defined to carry status information and error codes. An OpenLCB Error code is a 2-byte value of the following format:

170

Error Code Format	
Bits	Description
12-15	Error type flags. Zero or one bit shall be selected.
8-11	Reserved. Send as zero, ignored on receipt.
4-7	General Error Enumeration 0-15. Default as zero, and ignored on receipt.
0-3	Reserved for use of specific protocols for error reporting. Interpretation of these bits will be defined in the specific protocol documentation. A value of zero in this field means no further information is available. Default as 0, and ignored on receipt.

The following General Error Codes are defined. All protocols shall use at least Error Codes 0x0000, 0x1000, and 0x2000, and may use the extended Error Codes.

General Error Codes	
Value	Description
Permanent Error Enumeration. Re-trying the same interaction will result in the same error.	
0x100x	Permanent error.
0x101x	Reserved.
0x102x	Source not permitted.
0x103x	Not found.
0x104x	Not implemented.
0x105x-0x107x	Reserved
0x108x	Invalid arguments. Some of the values sent in the message fall outside of the expected range, or do not match the expectations of the receiving node.
0x109x-0x10Fx	Reserved.
Temporary Error (resend OK). Re-trying the same interaction later is likely to succeed.	
0x200x	Temporary error, not further not specified.
0x201x	Timeout, the expected message or message-part did not arrive in time.
0x202x	Buffer unavailable or destination node busy.
0x203x	Reserved.
0x204x	Not expected, Out of order. An inconsistency was found in the message or frame sequence received, the arrived message is unexpected or does not match the state of the receiving node.
0x205x-0x207x	Reserved.
0x208x	Transfer error. The message or received message was ill-formed, failed checksum, or is otherwise uninterpretable. On CAN, this is handled by the hardware.
0x209x-0x20Fx	Reserved.
Reserved	
0x300x-0x70Fx	Reserved. Write as zero, ignored on read.
Accept Flag	
0x800x	Accept, no error. This value shall not be used in reject messages.

175 NB: Nodes may return 0x0000 as an error-code.

The following Error Codes may be specifically used by the Message Network Protocol:

Message Network Specific Error Codes	
Value	Description
Permanent Error Enumeration. Re-trying the same interaction will result in the same error.	
0x1041	Not implemented, subcommand is unknown.
0x1042	Not implemented, Datagram-type, Stream-type, or command is unknown.
0x1043	Not implemented, unknown MTI, or Transport protocol (datagrams/streams) is not supported.
Temporary Error (resend OK). Re-trying the same interaction later is likely to succeed.	
0x2011	Time-out, waiting for End-frame.
0x2041	Out of Order, Middle- or End-frame without a Start-frame.
0x2042	Out of Order, Start-frame before finishing previous message.

3.6 Routing

All messages may be, but are not required to be, presented to every node for processing.

- 180 Addressed messages shall to be routed to the addressed node. The node transmitting an addressed message addressed to itself shall take part in any interactions required by the message.

Unless otherwise specified in a protocol document, global messages shall be forwarded to all nodes. The node transmitting a global message shall take part in any interactions required by the message.

3.7 Delays and Timeouts

- 185 Nodes shall send messages required by OpenLCB protocols within 750 milliseconds, unless otherwise indicated in the documentation for the specific protocol interaction.

Nodes may, but are not required to, use a timeout mechanism to protect against messages lost due to malfunctions. Such a timeout shall not be shorter than 3 seconds.

4 Simple Node Protocol Subset

- 190 OpenLCB uses the Simple Node Protocol to distinguish a subset of global message types that are never needed by certain “simple” nodes. They can then be rapidly ignored by those nodes, and gateways can filter them from segments that contain only simple nodes, etc. It is not normative.

4.1 Protocol Description

- 195 Operationally, the simple node protocol is defined by the MTIs that carry a set Simple Node bit, plus all addressed messages. This section summarize received transmitted messages.

4.1.1 Messages Transmitted

Simple nodes may transmit any message, which shall be propagated normally.

4.1.2 Messages Received

Simple nodes shall receive any message specifically addressed to them, plus the following unaddressed global messages:

- Verify Node ID ;
- Verified Node ID;
- Protocol Support Inquiry;
- Identify Consumers;
- 205 • Identify Producers;
- Identify Events;
- Learn Event;
- P/C Event Report;

In the future, additional MTIs will be defined. If simple nodes need to received them, the MTI will indicate that via the Simple bit – see previous section.

4.1.3 Messages Not Received

Messages not listed in the section above do not need to be received by simple nodes.

4.1.4 Messages Directed at Gateways

Gateways need to know which nodes consider themselves to be Simple. These nodes shall use the variants of the Initialization Complete and Verified Node ID messages that indicate Simple Set Sufficient (0x0101 and 0x0171, respectively) to indicate to Gateways that they are simple nodes.

5 Gateway Processing

No Standard content, see TN for discussion.

6 Expansion

220 No Standard content, see TN for discussion.

7 CAN Adaptations

7.1 Introduction

This section specifies how the Common Protocols are mapped to the CAN. While CAN is relatively inexpensive and robust, it is limited by its bandwidth and its total frame size, which is about 12-bytes, and by its speed (125 kbps). Each CAN frame includes a header (29-bits) and a data-part (8-bytes). In addition, the CAN-header has special properties which both enhance and limit its use. The Common Messages are adapted to CAN by:

- The Common-MTI is shortened to 12 bits, and carried in the header.
- Node IDs are shortened to 12 bit CAN-Aliases.
- 230 • Longer messages are fragmented into one or more CAN-frames. Special frames formats are used to implement Datagrams and Streams.

These mappings result in a set of modified formats as documented in this section. This section's numbering parallels that of the Common sections.

<i>Common Message</i>	<i>CAN Mapping</i>	<i>Comment</i>
<i>Most messages</i>	<i>Usually single frame</i>	<i>Multiple frames are used for longer messages.</i>
<i>Datagram</i>	<i>First-, Middle-, ..., Last- frames</i>	<i>Small Datagrams may be carried by a single Only-frames.</i>
<i>Stream</i>	<i>Stream-Data-frames</i>	<i>A common Stream-message will be mapped to one or more Stream-Data-frames.</i>

235

7.2 Intended Use

CAN is intended as a local transport for smaller layouts, or for local segments on larger layouts. Accommodation and specialization is necessary to implement the protocols onto CAN because CAN frames are limited to about 12 bytes of information. The main mappings include a shortened CAN-MTI (12-bits) and the use of 12 bit aliases for Node Ids. These have implications for Gateways which are specified below.

240

7.2.1 References and Context

This Standard is in the context of the following OpenLCB CAN Standards:

- The OpenLCB CAN Frame Transfer Standard, which specifies transfer of OpenLCB messages over CAN segments. "CAN" refers to the electrical and protocol specifications as defined in ISO 11898-1:2003 and ISO 11898-2:2003 and their successors.

245

7.3 Messages

7.3.1 Message Format

The CAN mapping uses several formats. The general form of the CAN header is:

29-bit CAN Header								
Field	CAN prefix	Frame Format	Variable Field				Source ID	
Size & location	2 bits 0x1800,0000	3 bits 0x0700,0000	12 bits 0x00FF,F000				12 bits 0x0000,0FFF	
Value(s)	3	1,2,3,4,5,or 7	CAN-MTI or Destination Node Alias				Source Node Alias	
Up to 8 Byte Data-Part								
Byte#	0	1	2	3	4	5	6	7
Values	variable	variable	(Data)	(Data)	(Data)	(Data)	(Data)	(Data)

250

Table 1: CAN Frame Format

CAN frames also contain other bit fields not detailed here, including a DLC or length field.

7.3.1.1 CAN Prefix Field

The CAN Prefix Field contains control bits specific to CAN.

7.3.1.2 CAN MTI Mapping

255 The Common MTI is mapped to one of eight frame formats:

Frame Format	Meaning
0	(Reserved)
1	Global & Addressed MTI
2	Datagram complete in frame
3	Datagram first frame
4	Datagram middle frame
5	Datagram final frame
6	(Reserved)
7	Stream Data

Table 2: CAN Frame Format Values

7.3.1.3 Global and Addressed Messages, CAN Frame Format 1

Global and Addressed messages are those Common MTIs with the “stream and datagram” bits set to 0, and are mapped to and from CAN MTI format 1.

260 The CAN MTI is carried in the CAN header. It consists of the lowest-order 12 bits of the Common MTI, and, by implication has the “stream or datagram” and “special” bits as zeros.

29-bit CAN Header										
Field	CAN prefix	Frame Format	Static Priority	Type within Priority	Simple Node flag	Address Present	Event ID present	Modifier Bits	Source ID	
Size & location	2 bits 0x1800, 0000	3 bits 0x0700, 0000	2 bits 0x00C0, 0000	5 bits 0x003E, 0000	1 bit 0x0001, 0000	1 bit 0x0000, 8000	1 bit 0x0000, 4000	2 bits 0x0000, 3000	12 bits 0x0000, 0FFF	
Value(s)	3	1	CAN-MTI						Source Node Alias	
Up to 8-Byte Data-Part										
Byte#	0		1		2	3	4	5	6	7
Value	Optional Flags/Destn Alias or (Data)			(Data)	(Data)	(Data)	(Data)	(Data)	(Data)	(Data)

Table 3: CAN Frame Format 1

265 If the Address Present bit is set to 1, then the destination address is placed in the 1st two bytes of the data part of the CAN frame: the top nibble of the 1st byte contains flags (see below); the lower nibble of the 1st byte and the entire 2nd byte contain the 12-bit destination alias.

The format of this in binary is: **0brrff dddd, dddd dddd** (or in hex: **0xfddd**)

where:

- 270 • The two rr bits are reserved, and read and send as zeros.
- The two ff bits can be used for packing and unpacking large messages to a sequence of CAN frames, see below. The coding is:
 - 00 Only frame
 - 01 First frame of more than one
 - 10 Last frame of more than one
 - 275 • 11 Middle frame of more than 2.
- You can think of these as active-zero start and end bits, respectively.

CAN frames marked as First or Middle frame shall carry eight total data bytes. CAN frames marked as Last or Only frame shall have from two through eight total data bytes.

7.3.1.4 Datagram and Stream Messages, CAN Frame Formats 2-5 and 7

280 Frame Formats 2-5 and 7 are used specifically for Datagram and Stream messages.

7.3.2 States

There are no special provisions for CAN transport layer.

7.3.3 Definition of Specific Messages

285 CAN messages definitions parallel the common messages in section [#3.3.Definition of Specific Messages](#).

7.3.3.1 Initialization Complete

Name	Description	CAN-MTI	CAN Header	Data Content
Initialization Complete	Full protocol	0x100	[0x1910,0sss]	Full Source Node ID
	Simple-set sufficient	0x101	[0x1910,1sss]	

7.3.3.2 Verify Node ID

Name	Description	CAN-MTI	CAN Header	Data Content
Verify Node ID	Addressed	0x488	[0x1948,8sss]	fddd ⁶ , Optional Full Node ID
	Global	0x490	[0x1949,0sss]	Optional Full Node ID

7.3.3.3 Verified Node ID.

Name	Description	CAN-MTI	CAN Header	Data Content
Verified Node ID	Full protocol	0x170	[0x1917,0sss]	Full Source Node ID
	Simple-set sufficient	0x171	[0x1917,1sss]	

290 **7.3.3.4 Optional Interaction Rejected**

Name	CAN-MTI	CAN Header	Data Content
Optional Interaction Rejected	0x068	[0x1906,8sss]	fddd, error, MTI, optional info

7.3.3.5 Terminate Due to Error

Name	CAN-MTI	CAN Header	Data Content
Terminate Due to Error	0x0A8	[0x190A,8sss]	fddd, error, MTI, optional info

7.3.3.6 Protocol Support Inquiry

Name	CAN-MTI	CAN Header	Data Content
Protocol Support Inquiry	0x828	[0x1982,8sss]	fddd

⁶ “fddd” refers to a flag-nibble “f”, containing multipart flags, and the 12-bit Destination Node Alias “ddd”. See TN.

7.3.3.7 **Protocol Support Reply**

Name	CAN-MTI	CAN Header	Data Content
Protocol Support Reply	0x668	[0x1966,8sss]	fddd, Protocol flags

This shall be a multi-part message when there are more than 48 protocol-bits.

295 **7.3.4 Extensibility**

Since the earlier nodes may reply as soon as they have processed only the data of which they are aware, their replies may be earlier than the last message fragment is received. Sending-nodes shall be able to receive and process these replies as they are received.

7.3.5 Interactions

300 There are no special provisions for CAN transport layer.

7.3.6 Error Handling

There are no special provisions for CAN transport layer.

7.3.7 Routing and Sequencing

305 CAN implementations shall send the frames of a message consecutively on the CAN bus, with no frames of equal or lower priority being interspersed. Higher-priority messages may be sent in the middle of a lower-priority message, including when the higher priority message itself is fragmented into multiple frames.

Gateways shall reassemble the frames of fragmented messages before sending them out on data links that support the necessary message length, unless otherwise stated by a specific Standard.
